

二阶常系数非齐次线性微分方程(II)

主讲人: 刘秀平 教授

$$f(x) = e^{\lambda x} [P_l(x) \cos \omega x + P_n(x) \sin \omega x]$$

由Euler公式,得

$$\cos \omega x = \frac{e^{i\omega x} + e^{-i\omega w}}{2}, \quad \sin \omega x = \frac{e^{i\omega x} - e^{-i\omega x}}{2i},$$

$$f(x) = e^{\lambda x} \left[P_l(x) \frac{e^{i\omega x} + e^{-i\omega w}}{2} + P_n(x) \frac{e^{i\omega x} - e^{-i\omega x}}{2i} \right]$$

$$= \left[\frac{P_l(x)}{2} + \frac{P_n(x)}{2i} \right] e^{(\lambda + i\omega)x} + \left[\frac{P_l(x)}{2} - \frac{P_n(x)}{2i} \right] e^{(\lambda - i\omega)x}$$

$$= \left[P_m(x) e^{(\lambda + i\omega)x} + \overline{P}_m(x) e^{(\lambda - i\omega)x} \right] = f_1(x) + f_2(x)$$

$$\frac{P_l(x)}{2} + \frac{P_n(x)}{2i} = \frac{P_l(x)}{2} - \frac{iP_n(x)}{2} = P_m(x) \qquad \qquad \frac{P_l(x)}{2} - \frac{P_n(x)}{2i} = \frac{P_l(x)}{2} + \frac{iP_n(x)}{2} = \overline{P}_m(x)$$

其中 $m = \max\{l, n\}$ 。

$$y'' + py' + qy = f(x) \tag{1}$$

$$f(x) = e^{\lambda x} [P_l(x) \cos \omega x + P_n(x) \sin \omega x]$$

$$y'' + py' + qy = f_1(x) + f_2(x)$$

$$f_1(x) = P_m(x)e^{(\lambda+i\omega)x}, \quad f_2(x) = \overline{P}_m(x)e^{(\lambda-i\omega)x}$$

$$y'' + py' + qy = f_1(x) = P_m(x)e^{(\lambda + i\omega)x}$$

$$y_1^*(x) = x^k Q_m(x) e^{(\lambda + i\omega)x}$$
 (2)

k 按 λ +i ω 不是特征方程 r^2 +pr+q=0根、是特征方程的根而依次取为0,1。

$$f_2(x) = \overline{P}_m(x)e^{(\lambda - i\omega)x} = \overline{f}_1(x)$$

与 $y_1^*(x)$ 共轭的函数

$$y_2^*(x) = x^k \overline{Q}_m(x) e^{(\lambda - i\omega)x}$$
 (3)

$$y'' + py' + qy = f_2(x)$$

其中 $\bar{Q}_m(x)$ 为 $Q_m(x)$ 的共轭m次多项式。

$$y^{*}(x) = y_{1}^{*}(x) + y_{2}^{*}(x) = x^{k}Q_{m}(x)e^{(\lambda+i\omega)x} + x^{k}\overline{Q}_{m}(x)e^{(\lambda-i\omega)x}$$

$$= x^{k}e^{\lambda x}[Q_{m}(x)e^{i\omega x} + \overline{Q}_{m}(x)e^{-i\omega x}]$$

$$= x^{k}e^{\lambda x}[Q_{m}(x)(\cos\omega x + i\sin\omega x) + \overline{Q}_{m}(x)(\cos\omega x + i\sin\omega x)]$$

$$= x^{k}e^{\lambda x}[(Q_{m}(x) + \overline{Q}_{m}(x))\cos\omega x + i(Q_{m}(x) - \overline{Q}_{m}(x))\sin\omega x]$$

综上所述,可得下述结论:

$$y'' + py' + qy = e^{\lambda x} [P_l^{(1)}(x)\cos \omega x + P_n^{(2)}(x)\sin \omega x]$$

特解为

$$y^{*}(x) = x^{k} e^{\lambda x} [Q_{m}^{(1)}(x) \cos \omega x + Q_{m}^{(2)}(x) \sin \omega x]$$
 (13)

其中 $m = \max\{l, n\}, Q_m^{(1)}(x) 与 Q_m^{(2)}(x)$ 均为m次多项式,

k 按 λ +i ω 不是特征方程 r^2 +pr+q=0根、是特征方程的根而依次取为01。

特解的求法

例题 方程 $y''-2y'+2y=e^x(x\cos x+2\sin x)$ 具有什么样形式的特解?

解:
$$f(x) = e^{x}(x\cos x + 2\sin x) = e^{\lambda x}(P_{l}^{(1)}(x)\cos \omega x + P_{n}^{(2)}(x)\sin \omega x)$$

 $\lambda = 1, \omega = 1, P_{l}^{(1)}(x) = x, P_{n}^{(2)}(x) = 2. \implies \lambda + i\omega = 1 + i$
 $\Rightarrow l = 1, n = 0, m = \max\{l, n\} = 1$
齐次方程y" $-2y' + 2y = 0$
特征方程为 $r^{2} - 2r + 2 = 0$ 特征根为 $r_{1,2} = 1 \pm i$
 $\lambda + i\omega = 1 + i$ 是特征方程 $r^{2} - 2r + 2 = 0$ 的根, $\Rightarrow k = 1$
 $y^{*}(x) = x^{k}e^{\lambda x}(Q_{m}^{(1)}(x)\cos \omega x + Q_{m}^{(2)}(x)\sin \omega x)$
 $= xe^{x}(Q_{l}^{(1)}(x)\cos x + Q_{l}^{(2)}(x)\sin x).$

特解的求法

例题 求微分方程 $y'' + y = x + \cos x$ 的通解.

解: (1) 先求齐次方程的通解。

齐次方程y'' + y = 0 特征方程为 $r^2 + 1 = 0$

相应的特征根为 $r_{1,2}=\pm i$, 齐次方程y''+y=0通解为 $C_1 \cos x+C_2 \sin x$,

其中C₁,C₂为任意常数.

(2) 求非齐次方程的特解。

$$f(x) = x + \cos x$$
 $f_1(x) = x, f_2(x) = \cos x$

设 $y'' + y = f_1(x) = x$ 的特解为 y_1^* , $y'' + y = f_2(x) = \cos x$ 的特解为 y_2^* 则 $y^* = y_1^* + y_2^*$ 是原方程的特解。

特解的求法

$$y''' + y = x = e^{0x}x = e^{\lambda x}P_m(x) \Rightarrow \lambda = 0, m = 1.$$
 由于 $\lambda = 0$ 不是特征方程的根, $y_1^* = x^k e^{\lambda x}Q_m(x) = Q_1(x) = ax + b$ $y_1^{*'} = a, y_1^{*''} = 0$ $y''' + y = x \Rightarrow a = 1, b = 0.$ $y_1^* = x \not \vdash y'' + y = x$ 个特解。 $y''' + y = \cos x$ 的特解 y_2^* $f_2(x) = \cos x$ $y_2^*(x) = x^k e^{\lambda x}(Q_m^{(1)}(x)\cos \omega x + Q_m^{(2)}(x)\sin \omega x).$ (13)
$$\Rightarrow \lambda = 0, \omega = 1, m = 0.$$
 由于 $\lambda + i\omega = i$ 是特征方程的根,所以k=1.
$$y_2^*(x) = x(Q_0^{(1)}(x)\cos x + Q_0^{(2)}(x)\sin x) = x(a\cos x + b\sin x).$$

$$y_2^{*''}(x) = 2(b\cos x - a\sin x) - x(a\cos x + b\sin x) \ y_2^{*''}(x) + y_2^*(x) = 2(b\cos x - a\sin x) = \cos x.$$

$$\Rightarrow a = 0, b = \frac{1}{2}. \ y_2^*(x) = \frac{1}{2}x\sin x. \ y^* = y_1^* + y_2^* = x + \frac{1}{2}x\sin x.$$
 通解 $y = C_1\cos x + C_2\sin x + x + \frac{1}{2}x\sin x.$

谢谢!
